Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              g
                                                                                                                                                                                                                            This clone was sequenced as part of a high-throughput process to sequence clones from Drosophila Gene Collection 1 (Rubin et al., Science 2000). The sequence has been subjected to integrity checks for sequence accuracy, presence of a polyh tail and contiguity within 100 kb in the genome. Thus we believe the sequence to reflect accuractly this particular CDNA clone. However, there are artifacts associated with the generation of CDNA clones that may priming, priming from contaminating genomic DNA, retained internal priming, priming from contaminating genomic DNA, retained internal due to reverse transcription of unspliced precursor RNNs, and reverse transcription of unspliced precursor RNNs, and reverse transcription about this sequence, including its location and relationship to other sequences, please visit our Web site (http://fruitfly.berkeley.edu) or send email to

This clone was sequenced as part of a high-throughput process to
This clone was sequenced as part of a high-throughput process to
sequence clones from Drosophila Gene Collection 1 (Rubin et al.,
Science 2000). The sequence has been subjected to integrity checks
for sequence accuracy, presence of a polyA tail and contiguity
within 100 kb in the geneme. Thus we believe the sequence to
reflect accurately this particular cDNA clone. However, there are
artifacts associated with the generation of CDNA clones that may
have not been detected in our initial analyses such as internal
priming, priming from contominating genomic DNA, retained introns
due to reverse transcription of unspliced precursor RNAS, and
                                                                                                 1455

The invention describes an isolated tumour necrosis factor polypeptide (TMF). The polypeptide and polymucleotide are useful in controlling agriculturally important peets, particularly by modifying the growth, feeding and/or reproduction of crop-damaging insects or insects of farm animals. The polypeptide and polymucleotide are useful for modulating the polymeptide and polymucleotide may be useful for modulating the polymeptide and polymucleotide may be useful for treating. Thus ameliorating or preventing X-linked anhidrotic (hypohidrotic) ectodermal dysplasia and X-linked anhidrotic (hypohidrotic) ectodermal dysplasia-like disorders, e.g. sparse hair, abnormal or missing teeth or sweat gland aberrations in animals (e.g. insects and potentially humans), condotxic shock, inflammation, haemorrhagic necrosis of tumours, cytotoxicity and obesity-linked insulin resistance, all of which involve necrosis factor variant 2 (TNFv2) protein, described in the invention

The invention describes an isolated tumour necrosis factor polypeptide and polynucleotide are useful in controlling agriculturally important pests, particularly by modifying the growth, feeding and/or reproduction of crop-damaging insects or insects of farm animals. The polypeptide and polynucleotide are useful for modulating controlling modified and polynucleotide are useful for modulating the polypeptide and polynucleotide may be useful for treating.

Thus controlling or preventing X-linked anhidrotic (hypohidrotic) ectodermal or spalaria and X-linked anhidrotic (hypohidrotic) ectodermal dysplasia and X-linked anhidrotic (hypohidrotic) ectodermal or sweat like disorders, e.g. sparse hair, abnormal or missing teeth or sweat cland aberrations in animals (e.g. insects and potentially humans), condotoxicis shock, inflammation, haemorrhagic necrosis of tumours, cytotoxicity and obesity-linked insulin resistance, all of which involve TNF molecules. This sequence encodes the drosophila melanogaster tumour necrosis factor (TNF) protein, described in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  61 CAAGCGCGTGCGTGCATGATAGCGAAGAAAAAAGCTATCCGTTTCAGTTAACTACTTAC 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention describes an isolated tumour necrosis factor polypeptide (TNF). The polypeptide and polynucleotide are useful in controlling agriculturally important peets, particularly by modifying the growth, feeding and/or reproduction of crop-damaging insects or insects of farm animals. The polypeptide and polynucleotide are useful for modulating ceptubalial morphogenesis, cell-matrix adhesion in files and mammals. Thus the polypeptide and polynucleotide are useful for modulating the polypeptide and polynucleotide may be useful for treating, ameliorating or preventing X-linked anhidrotic (hypohidrotic) ectodermal dysplasia-like disorders, e.g. sparse hair, abnormal or missing teeth or sweat gland aberrations in animals (e.g. insects and potentially humans), endotoxic shock, inflammation, haemorrhagic necrosis of tumours, cytotoxicity and obesity-linked insulin resistance, all of which involve TNF molecules. This sequence encodes the drosophila melanogaster tumour necrosis factor variant 1(TNFV1) protein, described in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        693

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           383
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          83
                                                                                                                                                                                                                                                                                                            The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention suesful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABBS7737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      CTATAGCTCTGTGGATGATGTTGGCGCAGACTACGAGGACTACACCGATATGATAA

                The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLIG176-ABL30511), expressed DNA sequences (ABLIG175) and the encoded proteins (ABBS7737-ABB72072). The sequence data for this patent did not form part of printed specification, but was obtained in electronic format directly from MIPO at ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                 The sequence is that of an example randomising oligonucleotide which is used in the prepr. of mRNA encoding candidate polypeptides for the method of systematic polypeptide evolution by reverse translation (SpERT). The method provides a rapid way of isolating and identifying polypeptide ligands which bind to target mols. The polypeptide ligands can be used in inhibitors of target mol. The polypeptide ligands can be used in inhibitors of target mol. function, as probes, as sequestering agents, darug delivery whicles, modififers of hormone action and as catalysts.

SPERT is used to select novel polypeptides that bind the antibody of the epitope commonly recognised by the antisera from autoimmune mice which are the fip progeny of a cross of NZB and NZW parents (Portanova et al., J. Immunol. 144, 4633, 1990). The known epitope consists of ca. 10 amino acids at the N-terminus of the histone HZB protein. To make mRNA encoding candidate polypeptides a 5' fixed sequence composed of a 7' promoter sequence and a ribosome binding site which is recognised by both provaryotic and eukaryotic ribosomes, terminating in a restriction prokaryotic and eukaryotic ribosomes, terminating in a restriction prokaryotic sequence of example shown). A 3' fixed sequence of ca. 100 nucleotides lacking stop codons. In addition, a 3' sequence of ca. 100 nucleotides lacking stop codons. In addition, a 3' primer annealing site is provided so that CDNA synthesis can be accomplished on the mRNA recovered from partitioned ribosome complexes. See also AAQ36845-63. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                        ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence was used in an example illustrating an invention relating to a method for isolating a polypeptide ligand for a desired target molecule. The method involves synthesiating a nucleic acid mixture comprising mRNA having translateable and non-translatable regions and a mixture of nucleic acid.polypeptide copolymers, each comprising the mRNA and a polypeptide encoded by its associated mRNA. The copolymers are partitioned relative to their affinity to the target. The method is termed systemic polypeptide evolution by reverse translation (SPERT). The polypeptides ligands of small molecule targets are useful in assay methods, diagnostic procedures, cell sorting, as inhibitors of target molecule function, as probes, as should not and mave therapeutic uses as sequestering agents. The commone action and have therapeutic uses as sequestering agents. The target molecules include natural and synthetic polymers, including target molecules onch as drugs, metabolites, cofactors and toxins. Polypeptide molecules such as drugs, metabolites, cofactors and toxins. Polypeptide ligands are isolated and rapidly identified by this method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Isolating a polypeptide ligand to a target molecule, useful for diagnostic assays, comprises partitioning candidate mixtures comprised of ribosome complexes or mRNA.polypeptide copolymers relative to their affinity to the target molecule.
                                                                                                                                                                          ligand isolation; systemic polypeptide evolution by reverse translation;
                                                                                                                   Sequence containing a 120 repeat of ACG flanked by fixed fragments.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    3.1%; Score 66.8; DB 5; Length 390; 48.9%; Pred. The sequences given in AA172769-81 are oligonuclectides which were used to make mRNA encoding a candidate polypeptide, a 5' fixed sequence composed of a 17 promoter sequence and a ribosome binding site which is recognised by both prokaryotic and eukaryotic ribosomes, terminating in a restriction endonuclease site. The resulting nucleic acid was used in the method of the invention for preparing ligands of target molecules in which mixtures of ribosome complexes or mRNA.circle-solid.polypeptide copolymers (mRcs.pCs) are partitioned by affinity to the target and amplified to create candidate mixtures enriched in ribosome complexes or mRs.pCs with an affinity to the target. Are new those are termed SPERT (Systematic Polypeptide Evolution by Reverse Translation). The SPERT methods are useful for isolating polypeptide ligands for desired
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New methods (termed SPERT (Systematic Polypeptide Evolution by Reverse Translation)) for selecting high-affinity polypeptide ligands that specifically bind target molecules, e.g. proteins, carbohydrates, toxins,

target molecules. The polypeptide products are useful for any purpose to which a binding reaction may be put, for example in assay methods.

C diagnostic procedures, cell sorting, as inhibitors of target molecule function, as probes, as sequestering agents and the like. In addition, polypeptide products of the invention can have catalytic activity. Target molecules include natural and synthetic polymers, including proteins, complexities, and small molecules, but and cell surfaces, coplysaccharides, glycoproteins, hormones, receptors and cell surfaces, cot transition state analogues and toxins. The novel SPERT method involves utilizing a candidate mixture of polypeptides having a randomized amino acid sequence. Each member of the mixture is linked to an individualized mRNA, which encodes the amino acid sequence of that polypeptide. The candidate polypeptides are partitioned according to their property of candidate polypeptides are partitioned according to their property of binding to a given desired target molecule. The partitioning is carried out in such a way that each mRNA encoding a polypeptide is partitioned exactly together with the means for further amplifying it by an in vitro process. Ultimately, both the desired optimal polypeptide are started and the mRNA encoding the polypeptide are considered, allowing further synthesis of the selected oplypeptide as desired, and further synthesis of the selected oplypeptide as desired, and further amplification of the coding sequence of the reference property of the means for in chemistry) in order to produce it in the analyse the amino acid sequence of the acide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          desired quantities

involved in plant resistance or response to pathogenic infection. Mi comprises identifying a gene whose expression is significantly altered in the incompatible interaction of plant gene expression relative to expression of the gene in an uninfected plant, in a mutant plant that does not express a gene associated with response to pathogenic infection, or in a corresponding incompatible or compatible interaction. (MI) is useful for conferring resistance to resistance or tolerance to a plant to bacterial, fungal or viral infection. The present sequence was used to

(KSHV) latency-associated nuclear antigen (LANA) gene. KSHV is also known as Human Herpes virus 8 (HHV8) and belongs to the rhadino virus, or gamma 2 herses virus class. The LANA protein is necessary for the efficient persistence of rhadino virus DNA in mammalian cells. Persistent rhadino virus infection is implicated in a variety of diseases e.g. Kaposi's Sarcona (KS). Primary Effusion Lymphoma (PBL) and multicentric catlement's disease. In addition, KS is a common malignancy in HIV patients. KSHV persists in host cells in a latent form. One of the few genes expressed from the latent viral DNA is LANA associates with both human chromosomes and with the rhadino virus cis-acting element (RVCAB), thereby providing a tethering function: the KSHV DNA episome is "tied" to the host cell. The present sequence may be used to screen and identify molecules that inhibit LANA interaction with RVCAB, thereby interfering with the latency cycle of this virus. Potential antiviral treatments for the above mentioned diseases may therefore be based on LANA deregulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

The invention provides a composition comprising nucleic acid, histone HI forcein and expression vector operationally encoding a protein suitable for tethering the nucleic acid to the histone HI protein, where the tethering protein is LANA. The composition is useful in aiding the retention of the viral DNA in the host cell. The viral vector encodes a protein suitable for tethering DNA to Histone HI. Methods for screening for compounds which are agonistic or antagonistic for the tethering of viral proteins to histone HI and DNA binding sites are useful for developing the method of viral transfer. The composition has applications to gene therapy, including the treatment of multiple sclerosis. Parkinson's disease, Huntington disease and diabetes. The present sequence represents the nucleotide sequence of the Kaposi's sarcoma associated herpesvirus (human herpesvirus 8) latency-associated nuclear accidents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     987 ĠĠATGATĠAGGAĠĠAĠĊAĠGAĠACAGATGAĠGAĠĠAĠĠAĠGATGAĊĠĀĠĠĀĠAŢĠA 1046
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         cGAGGAGGATGACGAGGATGACGAGGAGGATGACGAGGATGACGAGGATGACGAGGAGGA 1166

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   948 CGACTATCCAAAAAGGTGGATGGCCTCACGGATGAGGAGGACGACGACGATGGCGATGG 1007
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes a system (A) for maintaining a plasmid as an episome in mammalian cells, comprising the rhadinoviral sequence LANA (latency-associated nuclear antigen) of 3489 base pairs (see ABA33487, S1) expressed in the cell, and the rhadinoviral sequence RVCAE (rhadinoviral cis-acting element) of 801 base pairs (see ABA3348, S2) present in the plasmid. Also describes is a method for maintaining a closed circular DNA in a cell by expressing (S1) in the cells and having particularly used in gene therapy (or other gene transfer applications) particularly used in gene therapy (or other gene transfer applications) persistence of gene therapy vectors in cells. The present sequence encodes Kaposi's sarcoma-associated herpesvirus (KSHV, also called human herpesvirus 8) LANA protein, which is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  System for episomal retention of plasmids in mammalian cells, useful in gene therapy, comprises rhadinoviral LANA and RVCAE sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           828 GCATCTGGACAAGGAGCTGAAGAGCCTGAAGCGAGTCGTCGATAATCTCCAGCAGCGTTT

This sequence is a fragment of the Kaposi's sarcoma-associated herpesvirus (KSHV) LUR (long unique region). This fragment contains coding regions for ORF65 which encodes capsid protein IV, ORF67, Which encodes tegument protein IV, ORF68 which encodes a glycoprotein, ORF93 which encodes kaposin, KI3, ORF72 which encodes glycoprotein, ORF93 which encodes immediate early protein (IEP), KI4 which encodes (V-adh), ORF74 which encodes G-protein coupled receptor, ORF75 which encodes tegument protein/FGARAT, KI5. KSHV is a new human Herpesvirus (HHV8) believed to cause Kaposi's sarcoma (KS) which is the most common form of neocuring in persons with acquired immune deficiency diagnosis and treatment of a subject with Kaposi's sarcoma and for detecting expression of a DNA virus associated with Kaposi's sarcoma in a
                                                                                                                                                                                                                                                                                                                              Kaposi's sarcoma, acquired immune deficiency syndrome, AIDS, DHFR, Bcl-2; dihydrofolate reductase, LUR; long unique region; vaccine; prophylaxis; diagnosis; treatment; HHVB; capsid protein IV; tegument protein IV; glycoprotein; kaposin; cyclin D; immediate early protein; IEP; OX-2; v-adh; G-protein coupled receptor; FGARAT; ds.

This sequence represents the long unique region and terminal repeat of the Kaposi's sarcoma-associated herpes virus (KSHV). KSHV is also known as human herpes virus 8 (HHVB). This sequence contains the DNAs of the invention which encode KSHV polypeptides selected from: (a) viral interleukin-6 (IL-6); (c) viral IRF1; (d) complement-binding protein; glycoproteins B, M or L; (d) capsid protein IV encoded by ORF5; and (e) immediate early protein ecoded by ORF73. Labelled probes for the nucleic acid, proteins encoded by IL and antibodies (Ab) specific for the proteins are useful for chetecting HHVB, specifically for diagnosis of Kaposi's sarcoma, in body cluids or tissue samples. HHVB infections can be treated with antisense or triplex forming molecules or agents that bind specifically to the protein. Ab may be used for prophylaxis or treatment of HHVB infection, while the protein can be used in protective vaccines. Ab may also be used to differentiate between lymphomas, and HHVB may be inplicated in many coher lymphoproliferative diseases such as lymphomas, leukaemia, splenomegaly and mycosis fungoides. Cells and animals containing the nucleic acid are useful for fung screening. HHVB derived peptides can be inhibited with methotrexate. These can also be used to determine the immune status of a patient infected with HIV. HYPB derived protein cural MIP III may be used as an anti-inflammatory agent for, e.g. treating rheumatoid arthritis. This sequence is stated as containing 81 correcting copen reading frames. (Updated on 27-AUG-2003 to correct OS field.)
